

Solution Challenge

Team Details

- a. **Team name:** Seeking Squad
- b. **Team leader name:** Devanshi Chauhan
- c. **Problem Statement:** Local NGOs and social groups collect valuable community data, but it is often scattered across different sources, making it difficult to identify urgent needs and allocate resources efficiently.

Our Solution – SevaSync AI

- **Centralized AI Hub:** Collects and analyzes real-time community reports using an AI-powered urgency engine.
- **Automated Triage:** Automatically ranks incidents based on severity, population impact and resource requirements.
- **Actionable Dashboard:** Provides NGOs with a real-time command center view for faster decision-making.
- **Localized Response:** Connects users with nearest volunteers and hospitals using smart mapping.

Key Features (Technical Depth)

- **AI Urgency Scoring:** Uses Natural Language Processing(NL heuristics to analyze report descriptions and assign priority.
- **Geospatial Visualization:** Interactive Leaflet maps with dynamic markers that change color based on urgency
- **Smart Volunteer Matching:** Algorithms that filter volunteers based on skill sets (Medical, Logistics, Rescue) and proximity.
- **Dynamic Analytics Dashboard:** Live tracking of KPIs like 'Resolution Rate', 'High Urgency Hotspots', and 'Volunteer Deployment'.
- **Automated Explanations:** The AI provides a reasoning for why a specific report was ranked as "High Priority".

How It works

- **Ingestion:** Users submit reports via mobile/web with location data
- **Processing:** FastAPI backend runs AI to assess urgency & needs
- **Prioritization:** Reports stored and pushed to dashboard in real-time
- **Assignment:** NGOs assign tasks to nearby skilled volunteers
- **Resolution:** Volunteers update the status on-field, closing the feedback loop and updating analytics.

System Architecture

PROCESS FLOW DIAGRAM – SevaSync AI

USE CASE DIAGRAM – SevaSync AI

ARCHITECTURE DIAGRAM OF THE PROPOSED SOLUTION – SevaSync AI

AI-Powered Platform for Service Optimization, Urgency Detection & Data-Driven Decision Making

Purpose: SevaSync AI architecture combines a modern web stack with an AI engine to process real-world data, detect urgency, generate insights, and empower organizations to take timely and effective actions.

SevaSync AI
AI for Social Impact

Technologies Used

Frontend

- React + Vite(UI)
- Tailwind CSS (Glassmorphism design)
- Leaflet.js (Maps)
- Recharts (Analytics)

Backend

- FastAPI (Python)
- SQLAlchemy (ORM)

Database

- SQLite (Relational storage)

AI Layer

- Custom NLP-based Urgency Scoring
- Scalable to Google Gemini API

Architecture

- REST APIs (JSON-based communication)
- Modular Service-Based Architecture

Tools

- Node.js, NPM, Unicorn, Git
- Postman (API testing)

AI-powered logistics and predictive recommendations for crisis management

Additional Details/Future Development

- **Gemini AI Vision:** Using Google's Gemini API to automatically analyze disaster photos for instant damage assessment.
- **Predictive Mapping:** Using ML to predict crisis hotspots before they happen based on weather and historical data.
- **Google Maps Routing:** Providing volunteers with real-time "safest routes" to avoid road closures during emergencies.
- **Offline Reporting:** Enabling SMS-based emergency reporting for areas with no internet connectivity.
- **Global Scalability:** Deploying on Google Cloud (GCP) to handle millions of reports simultaneously during large-scale disasters.
